

MCTX3420 Team 4: Progress Report #5

Sam Moore, Rowan Heinrich, Callum Schofield, James Rosher, Justin Kruger, Jeremy Tan

Work Done:

- Graph simulated sensors in JavaScript GUI
 - Used jQuery to make AJAX requests to server software
 - Used jQuery flot library to plot results
- Improve sensor API to allow for dumping of data to text file
- Control simulated actuator in JavaScript GUI
 - A login is required to modify actuator values
- Basic streaming of images to web page using OpenCV
- Fix memory leaks in OpenCV
- Test server software with JavaScript GUI on raspberry pi
- Initiate work on unit testing the server API (JUnit and jQuery framework)
 - Mitigate regression issues
- Investigate alternative design of GUI using Java (netbeans)
- Implemented AJAX functionality in GUI code
- Separated basic GUI code into functional units of Javascript
- Added Beaglebone Black code to the webserver to access sensor data
 - Opens ADC module, reads 12-bit data stream from module, saves value to file
- Code sections to read/write GPIO pins for digital use
 - Can read value from pin, write value to pin & set data direction
- Investigated PWM control for actuators (three 50Hz signals required)

Work Todo:

- Decide between JavaScript and Java GUI
 - Changing to a Java GUI would require modifications to the server side code
- Generate analog output on BeagleBone as required by Electronics team
- Add digital sensors/switches (GPIO pins) code to server side code
- Improve GUI design and layout
 - For example: Currently a graph is used for digital sensors. A "ON/OFF" image may be more appropriate.
- Improve server API to meet GUI requirements
 - For example: Currently the API only returns the last 10 data points recorded by a sensor. This can lead to gaps in the data plotted by the GUI.
- Add watchdog thread to check values of sensors are safe
- Write BOM (SD Card, Ethernet cable, Powered USB Hub)
- Make potentiometer to test ADCs on beaglebone
